

## 

## **Device** features

Ceramic enamelled steel tank with a single large area spiral coil dedicated to heat pump operation.

The body is made of a thick layer of rigid polyurethane insulation, which ensures a long maintenance of the hot water temperature and thus low operating costs. It is additionally covered with a grey leather-like material.

Ceramic enamel, applied by the "wet" method, is used to protect the exchanger against corrosion. Tank protection is supported by the use of magnesium anodes. It is also possible to use active titanium anodes, which do not require ongoing maintenance.
